2018 Excavation of a site on river gravels  
in the Cam/Granta valley, by Archaeological  
Solutions Ltd, took place in advance of gravel  
extraction and construction of a reservoir.  
The excavation revealed five phases of  
archaeological activity, beginning in the  
Neolithic period with evidence for episodic or  
seasonal occupation and burial. After a gap  
of several centuries, there were three phases  
of Middle Iron Age to early Roman activity  
representing the continuous development of  
the same system of enclosures focussed on a

central trackway. Domestic occupation was also evident in the form of partial ring gullies. During the Conquest period there was probably a landing site for boats operating on the former river channel evident at the site. Economic activity during these phases represents a mixed, surplus-generating economy and it is possible that river traffic played an important role in the trade of the agricultural surplus. Limited finds of later Roman artefacts indicate a continued Romano-British presence in the vicinity. The final phase of occupation is a small rural Anglo-Saxon settlement comprising seven sunken-featured buildings and associated pits. Environmental and soil micromorphological analysis from this phase has provided important information about the internal arrangement of SFBs and the processes associated with development of their fills.
